

## ABSTRACT

1           A method includes writing JAVA™ language source code that includes a  
2 definition of a generic class, generating an instance of the generic class; and  
3 compiling the instance of the generic class into common intermediate language  
4 code executable by a runtime engine. A system operably receives input  
5 representing a generic class definition in a JAVA™ language, receives source code  
6 that references the generic class, compiles the source code with an instance of the  
7 generic class into common intermediate language code executable by a runtime  
8 engine.
